

What is Gateway?

Gateway is:

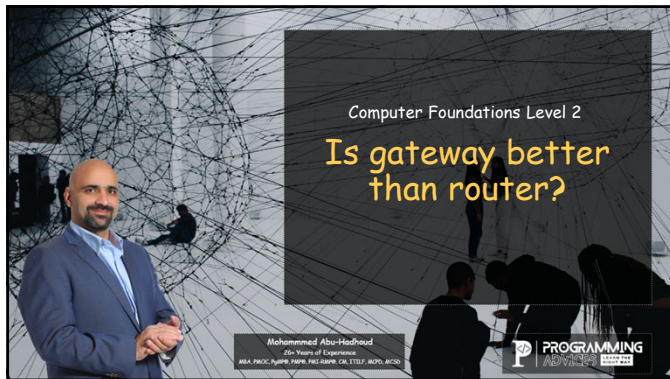

- A computer that sits between different networks or applications.
- The gateway converts information, data or other communications from one protocol or format to another.
- A router may perform some of the functions of a gateway.
- An Internet gateway can transfer communications between an enterprise network and the Internet.

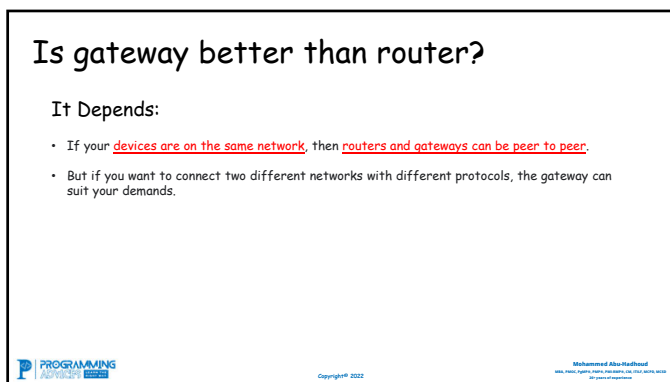

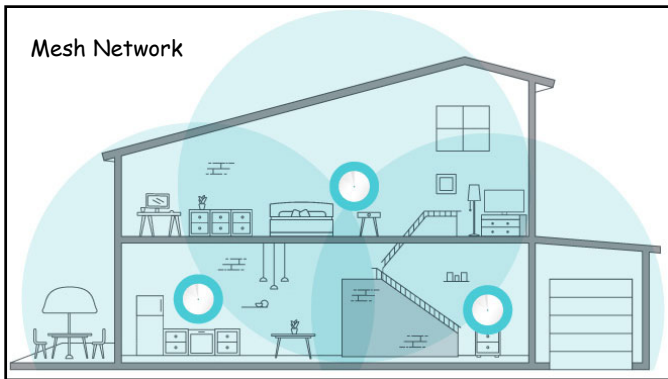

Is gateway same as router?

- A router is a device that is capable of sending and receiving data packets between computer networks.
- A Gateway, on the other hand, joins dissimilar systems.
- Gateway it is defined as a network entity that allows a network to interface with another network with different protocols.

What is Mesh Network?

- Mesh networks still have a router that connects to a modem, but it includes mini Wi-Fi devices that are set up around your home.
- These mini Wi-Fi devices, or nodes, communicate with each other and repeat the signal from your router from one node to another, which can extend the range of your wireless network.
- This means that your Wi-Fi connection will be strong in every corner of your house, even in areas where you may have previously had a hard time connecting.
